

## G2 T-joint Spacer

This helps to take out some of the slop in the main lifting foil. It is adjustable so you can tailor the fit to your daggerboard to make sure it is tight enough, but can still get it apart easily.

1. Insert both spacers over the t-joint and do up the screws so the spacer can still move up and down.
2. Move the spacers up or down, then tighten the screws. Moving it down will make the spacer wider, moving it up will make it narrower.
3. Test fit in your daggerboard and adjust if needed.
4. To make sure it doesn't move over time, you can glue it in with epoxy or a strong polyurethane adhesive.

Spacer Down and at its widest

Spacer Up and at its narrowest
