

Wand tube shim

You can put this in to tighten up the wand to reduce movement whilst sailing.

For beginner sailors, we suggest leave it out as it is easier to move the wand quickly without it in, Once you gain more experience, you may want to have the wand a bit tighter.

Use gel super glue as you have a little bit more time to work with.

1. put some glue across the plastic spacer and insert into the wand tube.

2. Position in place and insert the wand to hold the spacer in place as the glue dries. Make sure the cutout lines up with the rope feeder.
